GRAPHITE

INDUSTRIES LIMITED

CORPORATE PROJECT BRIEF

Proposed Graphite Mining, Processing and Value-Addition Project

Project location: Mpwapwa District, Dodoma Region, Tanzania

Planning capacity: 2,000 tonnes per day of run-of-mine (ROM) feed

Advancing Graphite. Creating Industrial Value.

Prepared for introductory engagement with prospective investors, industrial customers, technology providers and strategic partners.

DEVELOPMENT-STAGE CONCEPT — NOT AN OFFER TO INVEST

This draft uses only project details currently supplied for corporate communication. It does not establish mineral reserves, resource classification, mining rights, land title, permits, financing, product specifications, plant design, production forecasts or commercial agreements.

1. Company and Project Overview

GRAPHITE INDUSTRIES LIMITED is developing a graphite-focused mineral-processing and value-addition project concept in Mpwapwa District, Dodoma Region, Tanzania. The proposed initiative is intended to assess opportunities across graphite ore supply, beneficiation and potential downstream product development, subject to technical studies, regulatory approvals, commercial evaluation and investment decisions.

The project is at a development and planning stage. This brief is intended to support preliminary discussions and does not represent an operating mine or commissioned processing facility.

Project at a glance

Item	Current planning description
Company	GRAPHITE INDUSTRIES LIMITED
Project concept	Graphite mining, processing and potential value addition
Location	Mpwapwa District, Dodoma Region, Tanzania
Planning feed capacity	2,000 tonnes/day ROM feed (planning figure; not independently validated)
Operating basis	24 hours/day, three 8-hour shifts; 330 operating days/year (planning assumptions)
Indicative land area	Approximately 1,000 acres; tenure, boundaries and suitability require confirmation
Development status	Proposed project; studies, approvals, financing and implementation status require verification

2. Strategic Direction

The company’s stated direction is to evaluate an integrated graphite value chain rather than assume a single product or market in advance. The scope and sequence of development will depend on geological and mineralogical evidence, metallurgical test work, market specifications, infrastructure assessments, permitting requirements and funding.

Potential areas for evaluation include:

- Geological and mineralogical characterisation of graphite-bearing material.
- Metallurgical test work and beneficiation flowsheet development.
- Evaluation of concentrate quality, recovery and potential product specifications.
- Assessment of downstream value-addition opportunities where technically and commercially justified.
- Engagement with prospective buyers, technology providers, logistics operators and strategic investors.

No specific graphite product grades, recoveries, reserves, sales volumes, prices or customer commitments are asserted in this draft.

3. Project Development and Technical Workstreams

The following workstreams are proposed for evaluation. Their inclusion is not a claim that the work has been completed or contracted.

Geology and feedstock verification

Confirm the relevant mineral rights and lawful access to the deposit or feedstock source; compile available geological information; undertake representative sampling; and establish the appropriate resource or exploration work programme through qualified professionals.

Mineralogy and metallurgical testing

Characterise representative samples and assess liberation, beneficiation response, potential recovery, product quality and process variability. Test results should inform the process design basis and any subsequent equipment selection.

Process and infrastructure planning

Develop a concept-level flowsheet and evaluate water supply, grid electricity, access roads, transport options, tailings and waste management, site drainage, worker safety, dust control and environmental protection. Site measurements and utility capacities must be established through appropriate investigations.

Permitting, land and safeguards

Verify land rights and site boundaries; identify applicable mining, environmental, planning, water, occupational health and safety, construction and other statutory requirements; and determine the required approvals with the relevant Tanzanian authorities.

Commercial and investment assessment

Engage prospective technology providers, industrial customers, traders, logistics partners and investors to test product requirements, delivery conditions, project scope and possible cooperation structures. No financing or offtake commitment is represented as secured.

4. Infrastructure, Logistics and Market Access

Mpwapwa District is within Tanzania’s central region of the country. Road and rail options, including the wider central transport corridor and relevant railway networks, may be assessed as part of a logistics study. Actual route availability, terminal access, costs, transit times and suitability for graphite products remain to be confirmed.

Infrastructure planning should consider dependable electricity, water sourcing and recycling, communications, workforce access, safe product storage, packaging and transport. No utility connection, capacity, tariff or logistics agreement is claimed in this brief.

5. Sustainability and Responsible Development

The project should incorporate environmental and social considerations from the earliest planning stage. Topics for assessment include water stewardship, dust and noise control, energy efficiency, waste and tailings management, rehabilitation planning, biodiversity, community engagement, occupational health and safety, local employment, skills development and gender inclusion.

Specific targets, baseline data and commitments should be published only after the company has defined them, assessed feasibility and obtained any required approvals.

6. Partnership Opportunities

GRAPHITE INDUSTRIES LIMITED welcomes preliminary dialogue with suitable organisations that can contribute to project evaluation and development. Potential engagement areas include:

- Geological services, sampling and laboratory analysis.
- Mineralogical characterisation, metallurgical testing and flowsheet development.
- Process equipment and engineering services.
- Infrastructure, utilities, water and environmental services.
- Industrial customers and prospective graphite-product buyers.
- Logistics, export and supply-chain partners.
- Strategic investors and project-development partners.

Any cooperation would be subject to due diligence, scope definition, mutually agreed terms and applicable laws and approvals.

7. Proposed Engagement Process

Interested parties may begin with a non-confidential introduction outlining their capabilities, relevant experience, proposed scope and information requirements. Technical or commercially sensitive information should be exchanged only where appropriate and under agreed confidentiality arrangements.

A practical sequence for engagement is:

1. Introductory discussion and clarification of the party's role.
2. Exchange of available non-confidential project information.
3. Definition of required studies, technical scope or commercial requirements.
4. Due diligence and verification of relevant licences, data and counterparties.
5. Negotiation of any formal agreement, subject to approvals and internal authorisation.

8. Contact

Company	GRAPHITE INDUSTRIES LIMITED
Email	ce@graphiteindustries.co.tz
Telephone	+255 713 283 711
Office address	8th Floor, Morocco Squire, Mwai Kibaki Road, Kinondoni District, Dar es Salaam, Tanzania

Important Notice

This document is an introductory corporate project brief based on preliminary information supplied for drafting. It is not a prospectus, offer to sell securities, technical feasibility study, mineral resource or reserve statement, environmental approval, bankable feasibility study, guarantee of performance, or binding commercial offer. All planning figures are subject to verification and change. Prospective counterparties should conduct their own independent due diligence.
